

Net benefit (Vickers and Elkin) at threshold probabilities of 0.10, 0.30 and 0.50. Solid curves with filled markers show the original cohorts; dashed curves with open markers show the same data resampled to a common class prevalence. The dataset offering the highest net benefit changed after matching in 15 of the 24 model-label-threshold combinations, including both combinations in which it changed at all three thresholds. The dotted line denotes the treat-all strategy.
